

Rippling

# Product Design Lead, Design Systems

---

Dear Rippling Design Team,

Design systems have been the throughline of my career — not as a support function, but as the infrastructure that makes product speed and quality simultaneously possible. That's exactly the framing I see in how Rippling describes its platform approach, and it's why this role stood out.

At Rapid7, I lead design systems as a Principal Product Designer. The work I'm most proud of is our end-to-end MUI migration: I architected a multi-tier token system (primitive, semantic, and component-level), rebuilt our component library across typography, color, spacing, elevation, and motion, and partnered directly with the Frontend-Platform engineering team to ensure design intent translated to production quality. The migration touched every product surface at Rapid7 — a portfolio serving security operations teams where visual consistency and information density aren't aesthetic preferences, they're operational requirements.

Beyond execution, I built the governance model that makes the system self-sustaining: contribution frameworks, component request workflows, and a Design Forum that elevated systems thinking across a 40+ person design org. Designer enablement is as much a part of my systems work as the components themselves.

What draws me to Rippling specifically is the platform conviction. Most companies treat design systems as a cost center. Rippling treats it as a competitive differentiator — the connective tissue that makes a unified HR/IT/Finance experience possible rather than a collection of acquired products bolted together. I've operated at that level of strategic framing, and I want to do it somewhere the stakes are higher and the surface area is larger.

I'd welcome the chance to walk through my systems work in detail — the token architecture, the MUI migration playbook, and the governance model that keeps it maintained at scale.

Thank you for your time and consideration.
